# Solar PV Market Developments

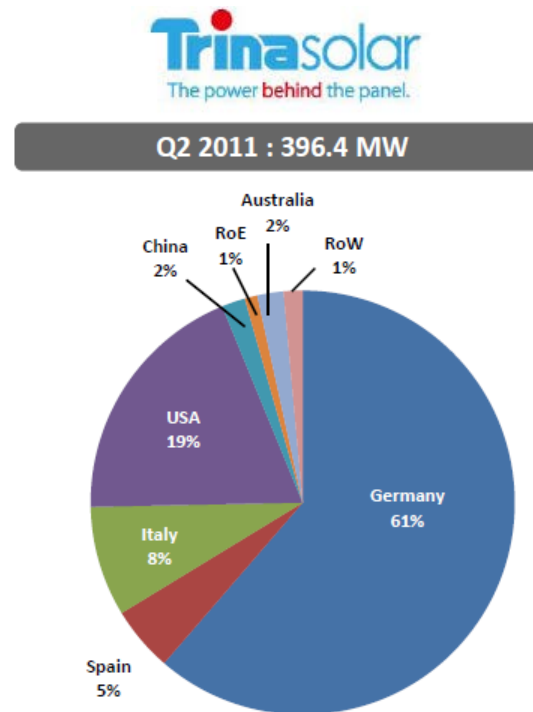

# Global U.S. Position Ceded to China & Taiwan

- Between 2000 and 2010 global shipments grew 53% (CAGR)
- U.S. market share slipped from 30% to 7% (30% CAGR)
- China/Taiwan grew from <2% to 54% (115% CAGR)

Sources: NREL chart using data from Mints, P.; Donnelly, J. (2011). "Photovoltaic Manufacturer Shipments, Capacity and Competitive Analysis 2010/2011." Report NPS-Supply 6, Navigant Solar Services Program. Palo Alto, CA.

# China Solar PV: Export Driven

- Meager domestic demand belies China's dominant production
- 9.3 GW<sub>P DC</sub> shipments vs. 0.5 GW<sub>P DC</sub> installed

Sources: NREL chart using data from European Photovoltaics Industry Association (EPIA). "Global Market Outlook for PV until 2015." <http://www.epia.org>  
Trina Solar (August 23, 2011). "Q2 2011 Supplemental Earnings Presentation."

# China's Focused Growth: (4) Key Players, All Si

Growth enabled by access to low cost debt, technology diffusion

Dominated by w-Si technologies, led by (4) key companies

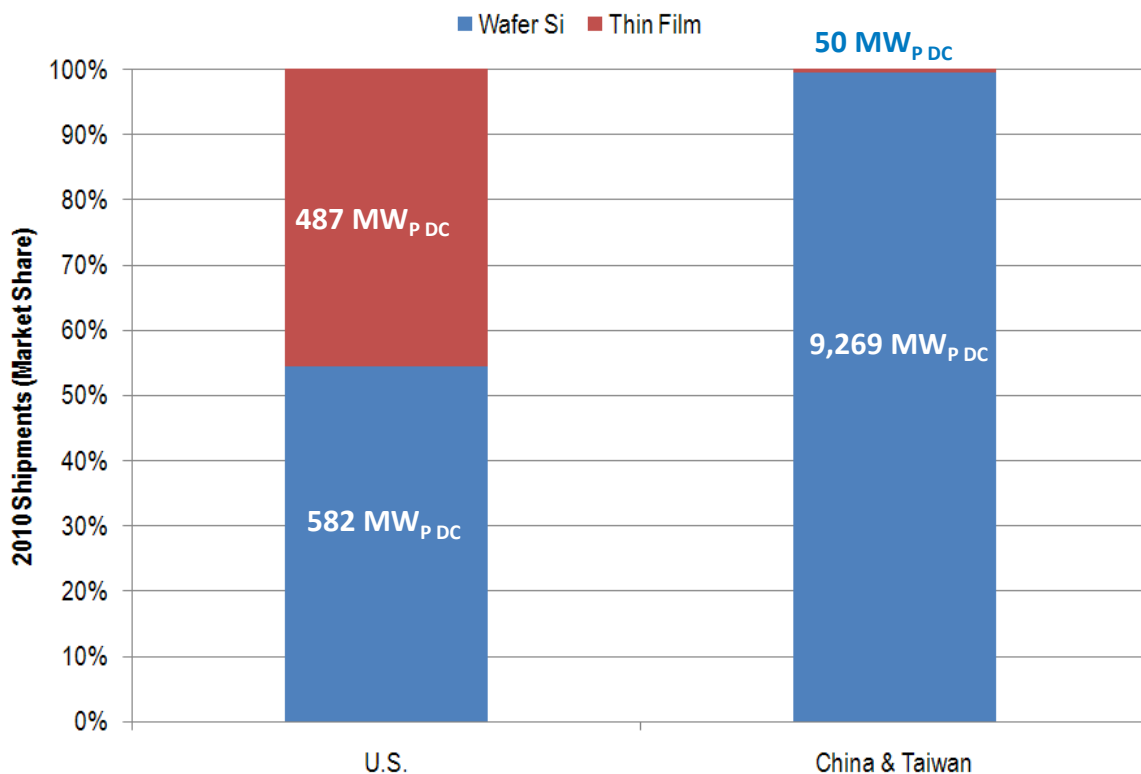

Sources: Mints, P.; Donnelly, J. (2011). "Photovoltaic Manufacturer Shipments, Capacity and Competitive Analysis 2010/2011." Report NPS-Supply 6, Navigant Solar Services Program. Palo Alto, CA.

de la Tour et al. (2011). "Innovation and international technology transfer: The case of the Chinese PV industry," *Energy Policy* 39 (2011) 761-770.

# U.S. Diversity vs. China Manufacturing Scale

- U.S. private investors encourage technology differentiation – opportunities for producers of innovative Thin Film PV technologies
- China’s government-backed investors fund more mature technologies – opportunities for w-Si technologies (quick scale-up; wages, exports)

2010 Regional Solar PV Module Shipments by Technology

*Wafer silicon is >85% of the global market*

Sources: Mints, P.; Donnelly, J. (2011). "Photovoltaic Manufacturer Shipments, Capacity and Competitive Analysis 2010/2011." Navigant Solar Services Program. Palo Alto, CA.

# Capital Sources Drive Solar Technology Mix

## 2009 ARRA Manufacturing Tax Credit (section 48C):

- "...have the greatest potential for technological innovation and commercial deployment."

## Energy Policy Act of 2005 (§1703 – Innovative Technology LG Program):

- "...employ new or significantly improved technologies as compared to commercial technologies."

## Recovery Act of 2009 (§1705 – Temporary LG Program for Deployment of Renewable Energy)

- Amended EAct §1703; Expired September 30, 2011.

*"The (Loan Guarantee) program was designed to provide support to these cutting edge industries, which have great potential to create jobs in whatever country wins the clean energy race, but also involve technology and market risks that private sector lenders often cannot or will not underwrite."*

*– Jonathan Silver, Executive Director LPO, U.S. DOE*

Sources: Graphic – Bloomberg NEF (4/9/10, 4/16/10, 11/8/10, & 3/16/11); J. Silver Testimony before the Subcommittee on Oversight and Investigations Committee on Energy and Commerce, U.S. House of Representatives (September 14, 2011)

# Best Research (Laboratory) Cell Efficiencies

- Single junction wafer Si approaching practical performance limit
- Challenge facing thin films: closing the gap between laboratory and production devices

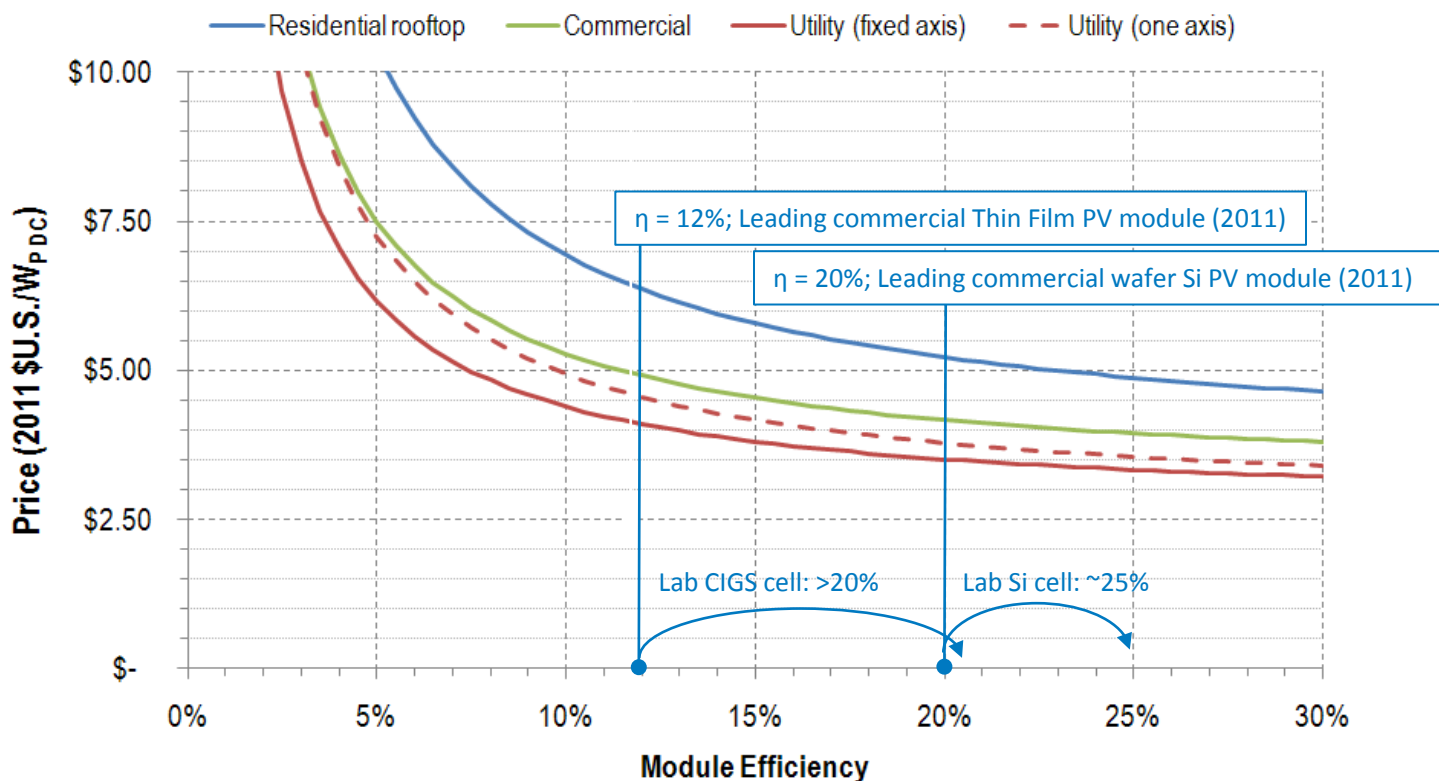

# Private Investors Value Thin Film PV Potential

## Thin Film PV technologies seek to close the gap: innovative, disruptive

- Startups raise capital based on defensible, disruptive IP position

### Installed Solar PV System Price

Sensitivity to module efficiency, rack mounted, standard installation methods, national average labor rates

Sources: Goodrich, A.; James, T.; Woodhouse, M. (2011). "Drivers of Residential and Utility Scale Solar Photovoltaic (PV) System Price in the U.S." NREL Technical Report. Golden, CO: National Renewable Energy Laboratory (NREL).

# International Investment Risk

# Other Investment Risk Considerations

<b>Country</b>	Political and economic stability Status, procedures, and maturity of legal system Transparency of business dealings
<b>Economic</b>	Expected inflation Local regulation
<b>Currency</b>	High cost and reliability of derivatives and other hedging instruments, particularly in emerging markets
<b>Security</b>	IP protection Property ownership, including the ability of creditors to repossess assets
<b>Financial</b>	Interest rates Insurance (business interruption)

Only *Economic, Financial* risks quantified in this analysis

Other factors partially considered by Global  $K_E$  approach

- *Security* risk factors related to IP, property ownership particularly important (innovative startup); binary considerations
- Access to subsidized China debt generally limits foreign ownership to minority stake, e.g., Evergreen-Jiawei JV

# Expected Inflation by Country

- Delta between U.S. and China as high as 470 bps
- China labor rates rose nearly 50% in 2010. Some expect 2011 China<sub>inflation</sub> 20%.

## Recent and Expected Inflation: by Country

### Impact of Inflation on capital budgeting decisions [2]:

- Revenues
- Costs (non-depreciation)
- Cost of debt capital ( $K_{D \text{ Nominal}}$ )
- Increased demand *Investments in non-financial assets.*
- Decreased supply *Regulators seek to limit growth*

Sources: [www.tradingeconomics.com](http://www.tradingeconomics.com)

# Market Volatility in the Global Equity Market

## Relative Performance of Global Stock Indices (Equity Betas)

$$\beta_{U.S.} = 0.90$$

$$\beta_{China} = 1.34$$

## Specific market volatility measured as $\beta_{Country}$

- Covariance of target country index & ACWI, divided by variance of ACWI

Source: Goodrich, A.; Woodhouse, M.; Hsu, D. (2011) Si Solar Manufacturing Cost Models. In preparation. Golden, CO: NREL MSCI website ([www.msclub.com](http://www.msclub.com)). Accessed September 9, 2011.

# Global CAPM Overview

$$\text{W.A.C.C.} = [(D/V) * K_D * (1 - \tau_c)] + [(E/V) * K_E]$$

## Levered, Nominal Cost of Debt ( $K_D$ ):

$$K_D = [(1 + R_f) * (1 + i) - 1] + \text{levered corporate bond spread}$$

## Levered Cost of Equity ( $K_E$ ):

$$K_E = K_{E \text{ Unlevered}} + [(D/E) * (K_{E \text{ Unlevered}} - K_D)]$$

Where, unlevered  $K_E$  is determined by unlevering  $R_E$ :

$$R_E = (K_D \text{ \& \text{CRP}}) + (\beta_{\text{Equity}} * \text{EMRP}_{\text{Global}})$$

Country Risk Premium (CRP):

$$\text{CRP} = R_{F \text{ Country}} - R_{F \text{ Global}}$$

Equity Market Risk Premium (EMRP):

$$\text{EMRP}_{\text{Global}} = \text{EMRP}_{\text{Country}} / \beta_{\text{Country}}$$

- Levered corporate bond spread estimated based on current (Q3 2011) U.S. bond spreads, estimate of best (unlevered) Solar PV bond rating (B for established player, low gearing)
- $\beta_{\text{Equity}}$  estimated based on private conversations with hVCs, PE firms, banks. Solar PV industry: 2.0. Startup, e.g., company profiled in the following case study: 3.5

# Manufacturing Subsidies by Country

	U.S. Loan Guarantee, Manufacturing Tax Credit	U.S. State Subsidies	China
Domestic proprietorship required?			Yes
Sales/Value Added Tax waiver?	Yes	Yes	
Property tax credits	100%	100%	N/A
Subsidized cost of debt	4.0%	3.0%	3.0-4.5%
Subsidized debt limit (D/ D+E)	60%	60%	80%
delay in processing subsidized debt	2 years	<1 year	<1 year
Facilities grant		100%	100%
Land grant			Discount purchase (land use rights)
Training grant (millions USD)	\$0.5-4.5	\$0.5-4.5	
Effective Corporate income tax rate	28%	28%	21%
Income tax credits	30% MTC <i>Cash Grant in lieu</i>	State: 5-7 year holiday	20 year holiday

# Solar PV Module Technologies

## Disaggregate supply chain

- Multiple players, some vertically integrated
- Intermediate products are relatively cheap to ship
- Wide range of automation levels
- Relatively mature, less tech. differentiation than TF PV

## Many flavors of TF PV

- Many opportunities for tech. differentiation
- Monolithically integrated
- Single factory: glass & gas in, modules out
- No intermediate products (shipping costs)
- Automation does not vary, regionally

# The Case for Foreign Direct Investment

China based c-Si PV manufacturer,  
U.S. customer (end market)

# Silicon Cell & Module Manufacturing

Illustration of a silicon cell line from the SCHMID Group | Gebr. SCHMID GmbH

- **Direct labor content varies from <1.0 job/MWP DC to 4.0 jobs/MWP DC**
  - Suntech automation strategy (~1.4 jobs/MWP DC) reflects inflation risk, not cost benefits
- **Relative to low cost labor regions, automation requires:**
  - 80% less direct labor content, 33% additional investment (automation)

500 MW <sub>P DC</sub> c-Si Cell & Module Facility	US			China		
	Cells	Modules	Total	Cells	Modules	Total
No. of Direct Laborers (all shifts)	296	104	<b>400</b>	1492	508	<b>2,000</b>
Unskilled Labor rate (\$ per hour)	\$13.33			\$2.13		
Manufacturing Engineer (\$ per year)	\$75,110			\$8,171		
Total facility Capex (\$/W <sub>p</sub> )	\$0.49	\$0.19	<b>\$0.68</b>	\$0.35	\$0.16	<b>\$0.51</b>

# China's Comparative Advantage: Si Cells

## Wafer Based Silicon Cell: Core Manufacturing Costs

14.4% standard monocrystalline cell, global wafer price: \$0.50/W<sub>P DC</sub>.

### Is China's comparative advantage sustainable?

Sources: Goodrich, A.; Woodhouse, M.; Hsu, D. (2011) Si Solar Manufacturing Cost Models. In preparation. Golden, CO: NREL National average labor rates assumed for U.S., China scenarios. "Discount materials": 10%.

"Discount equipment": 50% for wet benches, screen printer lines, co-firing furnace operations only.

"Core Costs" include direct labor, materials, energy, depreciation expenses, but exclude: shipping costs, cost of capital, taxes.

# Si Module Shipping Costs

## c-Si Solar PV Module Shipping Costs:

$\eta = 14.4\%$ , 504 modules per 40' High Container (HC),  
Shanghai to L.A. + 356 miles to Phoenix, AZ vs. 19 miles Goodyear, AZ to Phoenix, AZ

## Si PV Module Ship Costs: Breakdown

Sea (China to U.S.), Land Shipping

- Costs including fees, insurance are significant, total:  $\sim \$0.05/W_{p,DC}$
- Cost of capital excluded (Shanghai to Los Angeles: 30 day transit time)
- Cost of breakage excluded
- Shanghai to Hamburg, Newark to Hamburg costs roughly the same

Sources: (504) 27 kg modules/40 HC, STP280-24/Vd module datasheet. Suntech. EN-NA-STD-Vd-NO1.01-Rev 2010.  
Maersk online shipping calculator, NREL private conversation with Maersk sales representatives. 2011  
Bunker Adjustment Factor as of (March 31, 2011)  
Fuel surcharge based on \$3.96-\$3.99/gallon gas price. Average DOE diesel fuel surcharge. (March 2011)

# Regional Benchmarking Analysis:

## Direct Si PV Module Core Costs

### Note 1:

Cost structures that are heavily comprised of variable costs, including shipping costs are more sensitive to inflation.

### Expected inflation:

- China: 6.5%
- U.S.: 3.6%

### Note 2:

Based on one global wafer and cell prices (e.g. Chinese tier 1 module manufacturer can ship cells to U.S. module-assembly location for little cost).

- **China-direct (module) manufacturing cost benefits, excluding shipping: 1-2%**
- **Including shipping to U.S., China suffers a 5% cost disadvantage**
  - Above *Direct Costs* analysis excludes other regional factors: direct government subsidies, income taxes, global economic instability (inflation), and investment risk factors

Sources: Goodrich, A.; Woodhouse, M.; Hsu, D. (2011) Si Solar Manufacturing Cost Models. In preparation. Golden, CO: NREL  
Maersk online cost estimating tool (accessed March 2011). NREL internal shipping cost model.

12.  $K_{E \text{ Levered}} = K_{E \text{ Unlevered}} + [(D/E) * (K_{E \text{ Unlevered}} - K_{D \text{ nominal}})]$
13. As reported by PV start-ups investigating potential facility locations (2010).
14. 20 year China corporate tax holiday
15. U.S. Mean Effective Tax Rate (ETR): 28%; China 21%. Markle, S.; Shackelford, D. (2009). “Do Multinationals of Domestic Firms Face Higher Effective Tax Rates?” NBER Working Paper Series. NBER Cambridge, MA.
16.  $WACC = [(E/V) * K_{E \text{ Levered}}] + [(D/V) * K_{D \text{ nominal}} * (1 - T_c)]$

# Regional Benchmarking Analysis

## Minimum Sustainable CIGS PV Module Price

- The cost of China's subsidies (domestic proprietorship requirement, impact of significant government ownership on cost of equity) is largely left un-quantified in this analysis.
- Over past 2-3 years, the "U.S." (unsubsidized) case has largely been unavailable to innovative thin film startups. Unsubsidized access to capital in United States has been limited.

Sources: Goodrich, A.; Noufi, R.; Woodhouse, M. (2011). "CIGS Solar Manufacturing Cost Models." In preparation. NREL, Golden, CO  
NREL internal DCF (2011), including Global CAPM analysis and country based incentives (private conversations with PV companies)

# Summary

- **China is the world's leader in global production (55% market share)**
  - 95% of production is exported; no domestic demand
- **The U.S. is a leader in early stage technology investments that have disruptive potential**
- **Shipping costs offset China's core cost advantage**
  - c-Si module advantage reduced from 1% to **-5%**
  - CIGS advantage reduced from 10% to **-3%**
- **Access to low cost capital is needed to offset investment risk in emerging markets**
  - Cost of capital: China (26%)  $\xrightarrow{\text{with subsidy}}$  (18%), vs. U.S. (18%)
  - Inflation and changes in value of currency are significant

# Conclusions

---

- **China advantage may not be sustainable**
  - Inflation
  - Growing importance of shipping costs
  - Reliance on massive government subsidies
  - Lack of technology diversification
    - Risk of being supplanted by disruptive non-Si technology
- **U.S. incentives can level the playing field**
  - The scale of Chinese incentives dwarf U.S. efforts
  - Access to capital is a critical compliment to the United States' capacity to innovate

# U.S. Solar PV Opportunities and Challenges

## Comparative advantages

- Low cost electricity (hydro power and poly Si)
- Complimentary industries
  - Specialty chemicals, non-woven films (Dow, DuPont, 3m, Eastman Chemical, etc.)
- Institutional capacity for R&D (innovation)
- Private capital
- Demand potential

## Risk factors

- Material resource availability
- Policy uncertainty (R&D funding, industrial incentives)
- Inflation

# Acknowledgements

---

**Colleagues at NREL who have contributed through both formal and informal discussions. Special thanks to David Feldman, Robert Margolis, and Rommel Noufi.**

**Many industrial collaborators for their willingness to share data and provide invaluable external review.**

# APPENDIX

# c-Si Wafer Costs: 2011 Benchmark

- China's ingot and wafering advantage (~\$0.14/WP DC)
- Labor intensive, and difficult to fully automate.

# Regional Wafer Manufacturing

## Regional c-Si Wafer Manufacturing Cost Benefits

Quantifying the China-advantage. Cell efficiency: 16.7%.

Source: NREL internal cost model.

# c-Si Cell Costs: 2011 Benchmark

- Little difference in regional costs, but negligible shipping costs and manufacturing scale benefits (regional supply chain)
- Low cost Chinese equipment vendors (wet-benches, screen-printers, firing)
- Regional-differences in automation

# \$U.S. $1/W_{P_{DC}}$ Chinese w-Si Panels: Unsustainable

- Recent module price reductions driven by poly price, manufacturer scale, and level of vertical integration
- Can U.S. w-Si manufacturers survive latest price wars?

## c-Si PV Module Cost and Price Trends

Standard (Industry Median) Module Efficiency
